

Engineering excellence, *delivered.*

Company overview, products, and core capabilities

iFU Labs

AWS consultancy & cloud-native product studio

Remote-first · Globally distributed

WHO WE ARE

AWS consultancy built for *startups and scale-ups*.

iFU Labs is a remote-first team of AWS-certified engineers who help startups and fast-growing companies build, scale, and secure their cloud infrastructure — without the overhead of hiring a full platform team.

We pair deep AWS expertise with a product mindset. Beyond consulting, we build and operate two SaaS platforms — **Comply** and **FinOps** — that turn the same engineering rigor we bring to client work into self-serve software for teams that need continuous compliance and cloud-cost discipline.

How we work

01 Discovery. We review your infrastructure, spend, compliance posture, and team structure within 48 hours. An honest read on where you stand and what needs to change.

02 Architecture. We design a solution tailored to your constraints, roadmap, and budget. Every decision is documented with clear rationale before any code ships.

03 Delivery. Our engineers embed with your team and execute against a shared plan. Weekly standups, full Infrastructure-as-Code, no handover black boxes.

04 Handover. You own everything. Runbooks, Terraform, access, documentation. We train your team and leave them self-sufficient.

What sets us apart

Read-only by default. We never need write access to production. Every change ships as IaC you review and apply.

No vendor lock-in. All IaC, docs, and knowledge transfer included. Walk away any time.

Startup-focused. We've worked with teams from pre-seed to Series C — we know the constraints.

AWS Activate ready. We help eligible startups access up to \$100K in AWS credits and MAP funding.

PEOPLE WE SERVE

Built for the teams *we'd join.*

Our work concentrates on companies where engineering velocity, cloud cost, and regulatory readiness all matter at the same time — and where a small, senior team can move the needle without months of onboarding.

Early-stage startups

Pre-seed to Series A teams that need a credible AWS foundation, security posture, and SOC 2 readiness — without hiring a full platform team yet. We help you set up right the first time and unlock AWS Activate credits.

Scale-ups & growth-stage companies

Series B and beyond, where AWS bills are climbing, compliance audits are looming, and the platform team is stretched thin. We plug in to lead specific initiatives — FinOps, SOC 2, ISO 27001, HIPAA, GDPR — and hand them back fully owned.

Compliance-driven industries

Fintech, health-tech, AI, and B2B SaaS teams selling into regulated markets. Our Comply platform plus hands-on advisory shorten audit timelines and keep evidence collection automated — not a quarterly fire drill.

Cost-conscious engineering teams

Teams that have outgrown spreadsheet-based cost tracking and need real waste detection, rightsizing, and forecasts. Our FinOps platform gives engineering leaders a single pane of glass — and our consultants help act on it.

OUR PRODUCTS

Two platforms, *one engineering standard.*

We ship the tools we wished existed when we ran cloud and compliance ourselves. Both products live behind a single iFU Labs portal with shared identity, billing, and team management — adopt one, or both.

Comply — Continuous compliance, automated.

What it is. A SaaS platform that automates evidence collection, control monitoring, and audit readiness across SOC 2, ISO 27001, HIPAA, GDPR, and PCI DSS 4.0.

Who it's for. Engineering and security leaders who want compliance to be a continuous, automated process — not a quarterly scramble.

Why it matters. Audit prep that used to take 6–8 weeks of full-time effort drops to days. Evidence is captured automatically, control drift is caught the moment it happens, and auditors get the structured artifacts they expect.

FinOps — Cloud cost discipline, made visible.

What it is. A SaaS platform that scans AWS environments for waste, rightsizing opportunities, and unused commitments — with forecasts, recommendations, and automated reporting.

Who it's for. Engineering leaders, finance partners, and platform teams who need cost transparency and a clear list of actions, not just dashboards.

Why it matters. Teams typically uncover 15–30% of monthly AWS spend that can be optimized within the first scan. Recommendations come with one-line CLI commands so engineers can act in minutes.

Both platforms are built on the same engineering principles we apply to client work: Infrastructure-as-Code, read-only-by-default integrations, encryption at rest, and transparent pricing.

COMPLY · CORE FEATURES

How Comply works.

Frameworks & controls

Pre-built libraries for SOC 2 (~25 controls), ISO 27001 (~30), GDPR (~20), HIPAA (~15), and PCI DSS 4.0 (29 controls across all 12 requirements). Each control ships with a definition, severity, and the automated checks that produce its evidence.

Automated evidence collection

Connectors for AWS (IAM, S3, CloudTrail, RDS, GuardDuty), GitHub (branch protection, secret scanning, CODEOWNERS), and direct file upload. A daily scheduler runs control scans at 02:00 UTC, captures fresh evidence, and updates the audit trail.

Control drift alerts

When a control flips from passing to failing — a misconfigured bucket, a stale IAM policy, a missing branch protection rule — Comply emails admins immediately and posts a Block Kit notification to your Slack workspace. No more discovering issues during the audit.

AI-assisted remediation

Claude-powered explanations on every failing control, with concrete remediation steps and IaC suggestions. Cached for 24 hours and gated to Growth tier.

Audit-ready reporting

One-click PDF evidence reports per framework. Vendor risk register, team management, scan history, and outbound webhooks for control-drift and scan-complete events keep auditors and downstream tools in sync.

Plan tiers

Starter — SOC 2 only. **Growth** — adds ISO 27001, GDPR, HIPAA, PCI DSS, AI remediation, and webhooks. **Scale** — custom SLAs and dedicated support.

FINOPS · CORE FEATURES

How FinOps works.

AWS connection in minutes

Cross-account IAM-role connection using STS AssumeRole and an external ID — no access keys, no write permissions. We read Cost Explorer, EC2, RDS, EBS, ELB, and CloudWatch.

Eight categories of waste detection

Unattached EBS volumes · unused Elastic IPs · stopped EC2 instances older than 30 days · idle NAT gateways · idle RDS · unused ALB / NLB / Classic load balancers · snapshots older than 90 days. Each finding shows monthly and annual savings, the exact resource ID, and a CLI command to remediate it.

Rightsizing & commitment coverage

AWS-native rightsizing recommendations (top 20 by savings) and read-only RI / Savings Plan coverage so finance and engineering can plan commitments together.

Forecasting & custom date ranges

End-of-month spend forecasts plus arbitrary date-range scans. Multi-month ranges aggregate top services so you can compare periods side-by-side.

Recommendation workflow

Every recommendation has a state — Open, Snoozed, or Done — with inline filters so teams can triage findings the same way they triage tickets.

Scheduled scans & exports

Daily 03:00 UTC scans for active subscriptions, with CSV and JSON exports of all findings. Slack and email alerts for control-drift and significant cost movements.

AI summaries

Bedrock-powered (Claude) two-to-three-sentence executive summaries on each scan, with rule-based fallback so the dashboard always tells a clear story.

THE iFU LABS DIFFERENCE

Engineering rigor, applied *everywhere.*

Senior engineers, not pass-throughs. Every engagement is led by AWS-certified senior engineers. No project managers translating between you and offshore teams.

Read-only by default. Both our consulting work and our products are designed to never need production write access. You stay in control, always.

Documentation is the deliverable. Architecture decisions, runbooks, diagrams, IaC — fully documented and handed over. You own all the knowledge we create.

Self-sufficiency is the goal. We measure success by how soon you don't need us. We leave you with the skills, tools, and confidence to operate independently.

Transparent pricing. Fixed scopes, honest timelines, predictable SaaS tiers. No surprise invoices, no manufactured dependency.
